

Fabric tanks kept in the sun are left subject to UV damage. Ultraviolet rays from the sun break polymers down into shorter chains. When combined with dirt on the surface of the tanks, fabric can stiffen, crack, and yellow. These “burnt” areas can allow liquid to escape, rendering the tank unusable.

SEI’s SunShades are designed as protective covers for collapsible pillow tanks. They can reduce UV damage by up to 80%, extending the service life of the tank. On tank farms that have regular, prolonged exposure to sunlight, SunShades are ideal. They wrap around the tank and fittings, ensuring full coverage and easy installation. SunShades come in green-, tan- or black-colored fabric. White is also available on special order.

The SunShade can be attached when the tank is at any capacity, from empty to full. Because the cover is secured to the tank’s handles, it does not blow away in windy conditions.

Fabric Features

- Reduces UV damage by 80%;
- Easy to fold, store or transport;
- Easy to install over tank fittings and drains;
- Abrasion-resistant patches installed around fitting openings;
- Fuel-resistant durable material;
- Comes in four color choices;
- Hugs the tank, won’t blow away; and
- Can be installed on tanks regardless of their filled state.
